

December

12/10/2021

- Since we moved, everything had to be migrated to comcast's internet.
- All machines were down from 12/7 to 12/9
- Had to change ip for internal network on router from 10.0.0.X/32 to 192.168.X.X to match previous ip range
 - IP addresses for cluster nodes cannot change so we have to keep the internal network ips the same.
- I'm now using a tiny linode instance, using wireguard linked back the nginx reverse proxy
 - Largely followed [this guide](#), which requires some initial steps from [this guide](#).
 - Private and public wireguard keys generated using [this guide](#).
 - Seems to work well but jellyfin can't use large files since my upload speed on comcast is horrible.
- Modified google domains config to remove the dynamic dns entry and instead switched to a static A record.

Revision #3
