

Get my EGPU to work on opensuse tumbleweed with a framework 12th gen laptop

- With the laptop on, plug it in to the usbc cable
- load into a terminal and load the nvidia module `sudo modprobe nvidia`
- Verify that gpu is working using `nvidia-smi`. This may require installing nvidia-compute-utils
- Run `prime-select nvidia`
- log out of desktop
- start a terminal (ctrl alt f2)
- login
- run `startx`
