

NAS

Goals:

- I want to have a way to store my files for machines that are ephemeral
 - For example, *imara* is a node that is only on when I have analytics work to do. It would be ideal to store the results of the work done on these servers in a centralized location to enable access even when machines are powered off.
- I want to have scalability to large amounts of storage
- I want to have the throughput potential to use this as a storage array for containers if necessary
- I don't have much money to spend as I save for the wedding
